

Introduction to Modern Cryptography

Benny Chor

Identification (User Authentication)
Fiat-Shamir Scheme

Lecture 12

Tel-Aviv University

4 January 2010

Model and Major Issues

- Alice wishes to prove to Bob her identity, in order to access a resource, obtain a service, etc.
- Bob may ask the following:
 - ▶ Who are you? (prove that you are Alice)
 - ▶ Who the &\$@* is Alice?
- Eve wishes to **impersonate** Alice:
 - ▶ One time impersonation.
 - ▶ Full impersonation (identity theft).

Different Scenarios where Identification Required

- Local identification (identified person is present)
 - ▶ Human authenticator.
 - ▶ Device (e.g. BGU airport; Entry points to the US).
- Remote identification
 - ▶ Human authenticator
 - ▶ Corporate environment (e.g. over a LAN)
 - ▶ E-commerce environment
 - ▶ Cable TV/Satellite: Pay-per-view;
subscription verification
 - ▶ Remote login or e-mail from an internet cafe.

Initial Authentication is Highly Vulnerable

- The problem: how does Alice **initially** convince anyone that she is indeed Alice?
- Solution must often involve a "real-world" type of authentication – ID card, driver's license, etc.
- Errors due to the human factor are quite frequent.
- A famous incident took place in 2001, when VeriSign, the largest digital-signature certificate authority, was tricked into issuing Class 3 code-signing digital certificates to someone fraudulently claiming to work for Microsoft.
- Even in scenarios where OK for Alice to be whoever she claims she is, may want to at least make sure Alice is **human** (implemented, e.g. for new users attempting to join Yahoo mail).

Closed Environments

- The initial authentication problem is fully solved by a **trusted party**, Carol.
- Carol can distribute the identification material in a secure fashion, e.g by hand, or over encrypted and authenticated lines.
- Example – a corporate environment.
- Eve's attack avenue is the Alice-Bob connection.
- We begin by looking at remote authentication, using a specific scheme.

Fiat-Shamir Identification Scheme

- Initialization.
- Set Up.
- Basic Construction.
- Improved Construction.
- Zero Knowledge.
- Removing Interaction.

Fiat-Shamir: Initialization

- Bob gets from Carol $N = pq$ but **not** its factorization.
- Alice picks m numbers R_1, R_2, \dots, R_m in Z_N at random.
- Alice computes $S_1 = R_1^2 \pmod{N}, \dots, S_m = R_m^2 \pmod{N}$.
- Alice gives S_1, \dots, S_m to Bob.
- She keeps R_1, \dots, R_m secret.

Fiat-Shamir: Set Up

- Bob holds S_1, \dots, S_m .
- Alice keeps R_1, \dots, R_m secret.
- Who is Alice?
- Anyone who can convince Bob she can produce square roots mod N of S_1, \dots, S_m to Bob.
- She keeps R_1, \dots, R_m .
- A stupid way to convince Bob: Send him R_1, \dots, R_m .
- Instead, we seek a method that will give Bob (and Eve) nothing more than being convinced Alice can produce these square roots. (hint: zero knowledge).

Fiat-Shamir: Basic Protocol

- Let $S_1 = R_1^2 \pmod{N}$ such that Alice holds R_1 .
- To convince Bob that Alice knows a square root \pmod{N} of S_1 , Alice picks at random $X_1 \in \mathbb{Z}_N$, computes $Y_1 = X_1^2 \pmod{N}$, and sends Y_1 to Bob.
- Alice to Bob:
 - ▶ I know both a square root \pmod{N} of Y_1 (which equals X_1) and a square root \pmod{N} of $Y_1 S_1$ (which equals $X_1 R_1$).
 - ▶ Thus I know a square root \pmod{N} of S_1 (which equals R_1). But I'm not going to reveal it.
 - ▶ Instead, you (Bob) should make a choice which of the two you want me to reveal.
- Bob flips a coin. The outcome (heads/tails) determines the challenge he poses to Alice.

Fiat-Shamir: Basic Protocol, cont.

- If Alice knows both a square root of Y_1 (e.g. X_1) and a square root $\pmod N$ of Y_1S_1 (e.g. X_1R_1) then she knows R_1 .
- Thus if she does not know a square root of S_1 , she does not know at least one of the two square roots above.
- In such case, Bob will catch her cheating with probability at least $1/2$.
- In the protocol, Alice will produce Y_1, Y_2, \dots, Y_m .
- Bob will flip m coins b_1, b_2, \dots, b_m as challenges.
- Bob accepts only if Alice succeeds in all m cases.

Basic Protocol

1) Alice to Bob

b_1, b_2, \dots, b_m

$0, \dots, 0, 1$

2) Bob to Alice
(challenge)

3) Alice to Bob
(m responses)

Bob accepts iff all m challenges are met.

Improved (more efficient) Protocol

1) Alice to Bob

b_1, b_2, \dots, b_m

$0, \dots, 0, 1$

2) Bob to Alice
(challenge)

3) Alice to Bob
(two responses)

A blue arrow points from the text '3) Alice to Bob (two responses)' to a rectangular box containing two lines of text: 'Product of $X_i R_i$ with $b_i=1$ ' and 'Product of X_i with $b_i=0$ '.

Bob accepts iff two challenges are met.

Correctness of Protocol (Intuition Only)

- A cheating Eve, without knowledge of R_i s, will be caught with very high probability.
- **Zero Knowledge:** By eavesdropping, Eve learns **nothing** (all she learns, she can simulate on her own).
- Crucial ingredients:
 1. Interaction.
 2. Randomness.

Fiat-Shamir: Final Improvement (more efficient) Protocol

1) Alice to Bob

y_1, y_2, \dots, y_m

$b_1 b_2 \dots b_m =$
 $H(y_1, y_2, \dots, y_m)$
 $0, \dots, 0, 1$

2) Bob to Alice
(challenge)

3) Alice to Bob
(two responses)

Product of $X_i R_i$ with $b_i=1$
Product of X_i with $b_i=0$

Bob accepts iff two challenges are met.

Fiat-Shamir: Final Improvement – Removing Interaction

Let H be a cryptographically secure **hash function**.

1) Alice to Bob

$$\begin{aligned} b_1 b_2 \dots b_m = \\ H(y_1, y_2, \dots, y_m) \\ 0, \dots, 0, 1 \end{aligned}$$

~~2) Bob to Alice
(challenge)~~

3) Alice to Bob (**two** responses)

A blue arrow points from the text '3) Alice to Bob (two responses)' to a box containing the two responses: 'Product of $X_i R_i$ with $b_i=1$ ' and 'Product of X_i with $b_i=0$ '.

Bob accepts iff **two** challenges are met.

Correctness of Protocol (Intuition Only)

- A cheating Eve, without knowledge of R_i s, cannot succeed in producing, with non-negligible probability Y_1, Y_2, \dots, Y_m that will be hashed to a convenient bit vector b_1, b_2, \dots, b_m .
- This is because m is long and H behaves like a random function (so the chances of hitting a bit vector favorable to Eve are negligible).

- Remark: Fiat-Shamir scheme (the improved version) is used in practice.
